

# UMBC iPix Application Concept

- . Currently we have a Javascript/HTML applications that visualizes our floorplans online
- . We would like to place a central point in each room, that when clicked, would bring in a popup that would be the iPix image. We would essentially map the point, enable it to be "clicked" and on click- woud show the ipix imagery in a popup via an iframe. What we need is the widget/code that would be inbedded in the iframe.
- . To account for security concerns, we would like to host the iPix files on our server, and just utilize an iPix developed tool/widget to view our iPix files over the web inside of an iframe.
- . If possible, we would like the widget to have some of the functionality seen in previous versions , such as linked attributes/
